

CloudSight Suite

Control the in-home network

Control the fiber connected in-home network

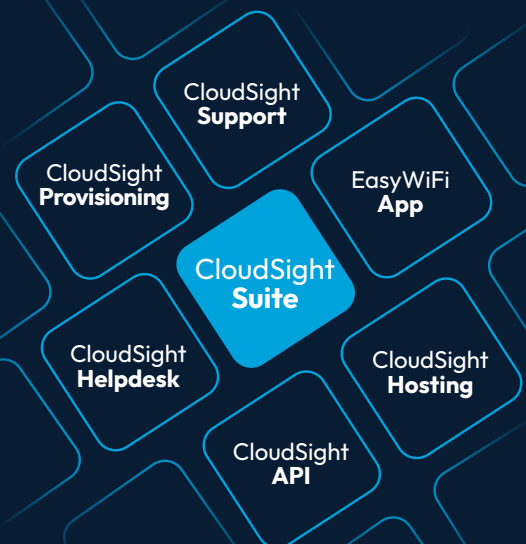

In-home network performance drives customer satisfaction and quality of experience. It is a vital aspect of your business. At the same time, complexity of in-home networks grows due to the continuous introduction of new devices, technologies, and services.

As a result of the growing need for home-based applications such as health monitoring, security, and remote working, in-home networks are being recognized as critical infrastructures.

Monitoring, managing and troubleshooting in-home networks often require multiple applications, which is complex, time consuming and costly.

CloudSight Suite

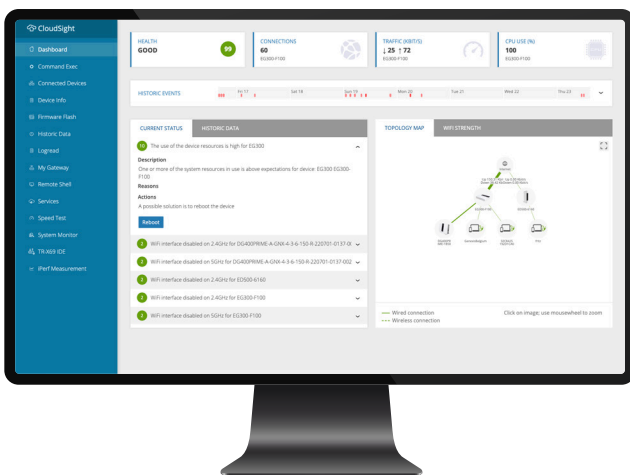

The CloudSight Suite offers a complete range of powerful management and provisioning tools, and supporting services to enable operators, and CSPs to take full control over their network.

CloudSight allows you to control the in-home network

Manage, monitor and troubleshoot all aspects of the end-user's in-home network in a single view. CloudSight includes features such as, service provisioning, device management and WiFi management.

With real-time performance insights, you are constantly aware of what is happening in the in-home network. In case of emerging issues, CloudSight allows you to proactively fix these. You solve the problem before the end-user realizes it.

Key features

- 360 view of the in-home network
- Device performance analysis
- Historic insights and root cause analysis
- Resolution recommendations
- Network topology and WiFi strength map
- Real-time speed and jitter tests
- Single touch problem resolution
